ACKNOWLEDGMENTS

I would like to express my deepest gratitude to my committee chair, Professor Akira Baba, who has given me constant encouragement as my academic advisor and went through all the painstaking procedure at the final stage.

My profound appreciation goes to my committee members, Professor Fumio Inoue, Professor Mayumi Usami, Professor Hiroko Saito, and Professor Nobuyuki Higashi, for their guidance and constructive suggestions. I am especially grateful to Professor Higashi, who became my advisor when I started the Master’s program in 1991, and guided me with tremendous support and generosity until his retirement in 1998, when I completed the dissertation proposal. Special thanks are also due to Professor Inoue for providing extensive comments, especially on the necessity to consider the phonological structure behind the subjects’ responses, despite many other demands on his time.

Professor Shigeru Takebayashi and Professor Hiroko Saito, who introduced me to the world of English phonetics, have been my backbone in ordering the otherwise chaotic English phones into an organization worth studying. They have been my source of influence ever since I entered college in 1987.

This thesis would not have existed without the constant encouragement and support of Dr. Naoyuki Takagi. Among a number of things I learnt, I should point out that he taught me how to apply statistics to the mass of experimental data. The influence of his teaching is apparent especially in Chapter 6.

10 Japanese students at the Tokyo University of Mercantile Marine and 15 native speakers of English served as subjects in the series of experiments. This thesis owes much to their goodwill, sincerity, and patience. I would like to thank Dr. Takako Ayusawa for her valuable advice on the initial draft of the thesis, and also for giving me an opportunity to present my findings at a PSJ meeting. I am grateful to Dr. Jonathan Goodacre for having gone through my writing at the final stage and having provided important suggestions as a psychoacoustician.

My thanks are also extended to a number of people who have crisscrossed my life in Hamamatsu, Tokyo, and Madison, Wisconsin, and have influenced me in various ways.

I wish to thank my husband Yoichiro Aoki, who has had to endure the frustrations of having a temperamental author in the house. He has understood what this research topic meant to me and has been supportive throughout.

My oldest memory as a child is of my father working on his dissertation on chemical engineering at West Virginia University. I have been very proud of what my parents accomplished when it was much more difficult for foreigners from an unprivileged country to survive and continue studying in the United States. I have been longing to achieve something similar myself for more than 20 years. I would not have chosen the topic of speech perception had it not been for the living experience of the first years of my life in the United States with my parents. I believe that this dissertation is rightly dedicated to my parents, Shigeo Uchida and Katsuyo Uchida, and to the happy old days at Morgantown, West Virginia.
